Reversible Computation: Extending Horizons of Computing Irek Ulidowski 2020-01-01 This open access State-of-the-Art Survey presents the main recent scientific outcomes in the area of reversible computation, focusing on those that have emerged during COST Action IC1405 "Reversible Computation - Extending Horizons of Computing", a European research network that operated from May 2015 to April 2019. Reversible computation is a new paradigm that extends the traditional forwards-only mode of computation with the ability to execute in reverse, so that

computation can run backwards as easily and naturally as forwards. It aims to deliver novel computing devices and software, and to enhance existing systems by equipping them with reversibility. There are many potential applications of reversible computation, including languages and software tools for reliable and recovery-oriented distributed systems and revolutionary reversible logic gates and circuits, but they can only be realized and have lasting effect if conceptual and firm theoretical foundations are established first.

Suicide Science Thomas Joiner 2007-05-08
Suicide kills and maims victims; traumatizes loved ones; preoccupies clinicians; and costs health care and emergency agencies fortunes. It should therefore demand a wealth of theoretical, scientific, and fiduciary attention. But in many ways it has Why? Although the answer to this question is multi-faceted, this volume not supposes that one answer to the question is a lack of elaborated and penetrating theoretical approaches. The authors of this volume were challenged to apply their considerable theoretical

wherewithal to this state of affairs. They have risen to this challenge admirably, in that several ambitious ideas are presented and developed. If ever a phenomenon should inspire humility, it is suicide, and the volume's authors realize this. Although several far-reaching views are proposed, they are pitched as first approximations, with the primary goal of stimulating still more conceptual and empirical work. A pressing issue in suicide science is the topic of clinical interventions, and clinical approaches more generally. Here too, this volume contributes, covering such topics as therapeutics

and prevention, comorbidity, special populations, and clinical risk factors.

Perceived Control, Motivation, & Coping Ellen A.

Skinner 1995-02-08 At every point in the lifespan, individual differences in a sense of control are strong predictors of motivation, coping and success and failure in a wide range of domains.

What are the origins of these individual differences, how do they develop and what are the mechanisms by which they exert such an influence on psychological functioning? To answer these questions, this book draws on theories and research covering key control

constructs, including self-efficacy, learned helplessness, locus of control and attribution theory. Skinner also considers such issues as: the origins of control in social interaction; environmental features that promote or undermine control; developmental change in the mechanisms by which experience

Culture, Self-Identity, and Work Miriam Erez
1993-08-12 A great deal of research has recently been completed on behavior and the organization of work, most of which has viewed it from an ethnocentric perspective. In this work, Erez and Earley show how this is insufficient to develop a global theory of work behavior--it necessitates the inclusion of a cultural perspective. Solidly grounding their work in the fields of psychology, management, and anthropology, the authors propose a new theoretical framework utilizing

individual's self-concept as a means of linking cultural beliefs and social interaction to emergent work behavior. The book includes specific recommendations for structuring work environments and managerial processes to match cultural practices and enhance productivity in the workplace, making it an essential reference for scholars, students, and professionals.

General and Specific Mental Abilities Dennis J.

McFarland 2020-05-07 The history of testing mental abilities has seen the dominance of two contrasting approaches, psychometrics and neuropsychology. These two traditions have different theories and methodologies, but overlap considerably in the tests they use. Historically, psychometrics has emphasized the primacy of a general factor, while neuropsychology has

emphasized specific abilities that are dissociable. This issue about the nature of human mental abilities is important for many practical concerns. Questions such as gender, ethnic, and age-related differences in mental abilities are relatively easy to address if they are due to a single dominant trait. Presumably such a trait can be measured with any collection of complex cognitive tests. If there are many specific mental abilities, these would be much harder to measure and associated social issues would be more difficult to resolve. The relative importance of general and specific abilities also has implications for

educational practices. This book includes the diverse opinions of experts from several fields including psychometrics, neuropsychology, speech language and hearing, and applied psychology.

Gaming, Simulations and Society International Simulation and Gaming Association. International Conference 2005 This collection of work from many of the foremost experts in the field offers

new information and ideas covering the current state of research in the field, new tools and approaches in the social sciences, decision-making techniques for business, and the application of simulation and gaming methods in education. The authors also examine the growing popularity of video games and assess both their positive and negative influences on society and learning. Consequently, it is

a work of groundbreaking originality.

Depression in Children's Lives Keith Crnic
2021-08-31 Although childhood depressive disorders are relatively rare, the experience of depression in children's lives is not. Developmental contextual perspectives denote the importance of considering both depressive

disorder and the experience of subclinical depressive symptoms in the child and the family to fully understand the implications of depressive experience for children's developmental well-being. This Element draws on basic emotion development and developmental psychopathology perspectives to address the nature of depressive experience in childhood, both symptoms and disorder, focusing on seminal and recent research that details critical issues regarding its phenomenology, epidemiology, continuity, etiology, consequences, and interventions to ameliorate the developmental challenges inherent

in the experience. These issues are addressed within the context of the child's own experience and from the perspective of parent depression as a critical context that influences children's developmental well-being. Conclusions include suggestions for new directions in research on children's lives that focus on more systemic processes.

Personality at Work Adrian Furnham 2002-09-11

Personality at Work examines the increasingly controversial role of individual differences in predicting and determining behaviour at work. It asks whether psychological tests measuring

personality traits can predict behaviour at work, such as job satisfaction, productivity, as well as absenteeism and turnover. Importantly, it is a critical and comprehensive review of that literature from psychology, sociology and management science which lies at the interface of personality theory, occupational psychology and organizational behaviour. Drawing on a vast body of published material, Adrian Furnham describes for the first time current state of knowledge in this area. The result is a volume which will be an enormously useful resource to the researcher and practitioner, as well as students of psychology,

management science and sociology. Personality at Work is the only exhaustive and incisive multi-disciplinary work to assess the role of psychological testing in the management of the work place.

Motivation and Child Maltreatment David J. Hansen 2000 In this volume, the concept of motivation is used to shed light on a range of complex issues surrounding the maltreatment of children. Cathy Spatz Widom investigates the role of motivation in the intergenerational transmission of violence, where victimized children themselves become perpetrators of violence as adults. Joel S. Milner looks at the way abusive parents process social information related to children. The biological, psychological, and social-contextual regulatory processes in maltreated children are considered by Dante Cicchetti and Sheree L.

Toth. Deborah Daro discusses the current status of efforts to eliminate maltreatment of children and offers an alternative model for approaching the concept and practice of prevention. John R. Lutzker addresses the challenges of and procedures for applied research on the treatment of abusive parents. In his concluding essay Ross A. Thompson highlights the important themes focusing on child maltreatment that underlie this volume. David J. Hansen is a professor of psychology and director of the Clinical Psychology Training Program at the University of Nebraska.
